

SURVEI IMPLEMENTASI PROGRAM SARINGAN PENDENGARAN KANAK-KANAK DI SELANGOR

Nordiana Ismail

The purpose of this study was to survey the implementation of a hearing screening program for children below 2 years old. It was done at government hospitals and health clinics using survey forms. There were 9 hospitals and 57 health clinics involved in this study. 54.55% of these centers had implemented hearing screening programs. 34 of these health clinics screened all children below 2 years old while two other clinics screened only those who were suspected to have hearing loss. Only one clinic uses physician as screener whereas the others use nurses. Distraction test was used to screen the children. The test was done using noise stick, bell, rattle and toys. Only 28 clinics recorded the test results in books, forms and computer. Diagnostic referral resources for the state of Selangor were Hospital Universiti Kebangsaan Malaysia (HUKM), Hospital Kuala Lumpur (HKL), Selayang Hospital, Audiology and Speech Science Clinic (KASP) and Universiti Hospital. From this study it is revealed that none of the government hospitals in Selangor had implemented hearing screening programs for children below the age of 2.
